

1.2) Derive the cyclicity (1.24) of the trace from Eq. (1.23).

Using the definition of the trace, we can write

$$\text{Tr}(AB) = \sum_{k=1}^n (AB)_{kk} = \sum_{k=1}^n \sum_{\ell=1}^n A_{k\ell} B_{\ell k}. \quad (1)$$

Note that this sum is symmetric in the indices $\{k, \ell\}$, and since $A_{k\ell}$ and $B_{\ell k}$ are just scalars

$$\text{Tr}(AB) = \sum_{\ell=1}^n \sum_{k=1}^n B_{\ell k} A_{k\ell} = \text{Tr}(BA). \quad (2)$$

1.3) Show that $(AB)^T = B^T A^T$, which is Eq. (1.26).

Recall the definition of a matrix transpose: $(A^T)_{ij} = A_{ji}$, so

$$(AB)^T_{ij} = (AB)_{ji} = \sum_{k=1}^n A_{jk} B_{ki} = \sum_{k=1}^n B_{ik}^T A_{kj}^T = (B^T A^T)_{ij}. \quad (3)$$

Hence,

$$(AB)^T = B^T A^T. \quad (4)$$

1.5) Show that $(AB)^\dagger = B^\dagger A^\dagger$, which is Eq. (1.29).

Recall that the hermitian adjoint of a matrix is just $A^\dagger = (A^T)^*$, so

$$(AB)^\dagger = ((AB)^T)^* = (B^T A^T)^*. \quad (5)$$

Observe that

$$(AB)^*_{ij} = \left(\sum_{k=1}^n A_{ik} B_{kj} \right)^* = \sum_{k=1}^n A_{ik}^* B_{kj}^* = (A^* B^*)_{ij}, \quad (6)$$

so Eq. (5) becomes

$$(AB)^\dagger = (B^T A^T)^* = (B^T)^* (A^T)^* = B^\dagger A^\dagger. \quad (7)$$

1.7) Show that the two 4×4 matrices (1.46) satisfy Grassman's algebra (1.11) for $n = 2$.

The matrices in Eq. (1.46) are given by

$$\theta_1 = \begin{pmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad \text{and} \quad \theta_2 = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}. \quad (8)$$

Using the kronecker delta, notice that we can write the components of θ_1 and θ_2 as follows:

$$(\theta_1)_{ij} = \delta_{i1}\delta_{j3} - \delta_{i2}\delta_{j4} \quad (9)$$

$$(\theta_2)_{ij} = \delta_{i1}\delta_{j2} + \delta_{i3}\delta_{j4}. \quad (10)$$

Thus,

$$(\theta_1\theta_2)_{ij} = \sum_{k=1}^n (\theta_1)_{ik}(\theta_2)_{kj} \quad (11)$$

$$= \sum_{k=1}^n \delta_{i1}\delta_{j2}\delta_{k3}\delta_{k1} + \delta_{i1}\delta_{j4}\delta_{k3}\delta_{k3} - \delta_{i2}\delta_{j2}\delta_{k4}\delta_{k1} - \delta_{i2}\delta_{j4}\delta_{k4}\delta_{k3} \quad (12)$$

$$= \delta_{i1}\delta_{j4}. \quad (13)$$

In the same way,

$$(\theta_2\theta_1)_{ij} = \sum_{k=1}^n (\theta_2)_{ik}(\theta_1)_{kj} \quad (14)$$

$$= \sum_{k=1}^n \delta_{i1}\delta_{j3}\delta_{k2}\delta_{k1} - \delta_{i1}\delta_{j4}\delta_{k2}\delta_{k2} + \delta_{i3}\delta_{j3}\delta_{k4}\delta_{k1} - \delta_{i3}\delta_{j4}\delta_{k4}\delta_{k2} \quad (15)$$

$$= -\delta_{i1}\delta_{j4}. \quad (16)$$

Thus, since addition is defined component wise, we have the anticommutator

$$(\{\theta_1, \theta_2\})_{ij} = \{(\theta_1)_{ij}, (\theta_2)_{ij}\} = \delta_{i1}\delta_{j4} + (-\delta_{i1}\delta_{j4}) = 0 \quad (17)$$

$$\Rightarrow \boxed{\{\theta_1, \theta_2\} = 0}. \quad (18)$$

1.12) Show that the Minkowski product $(x, y) = \vec{x} \cdot \vec{y} - x^0 y^0$ of two 4-vectors x and y is an inner product obeying the rules (1.78, 1.79, 1.84).

The three properties we check for this inner product are as follows:

$$(f, g) = (g, f)^* \quad (19a)$$

$$(f, zg + wh) = z(f, g) + w(f, h) \quad (19b)$$

$$(f, g) = 0 \text{ for all } f \in V \Rightarrow g = 0. \quad (19c)$$

For the following, we assume that x, y are real 4-vectors. That is, their components are real numbers.

From this assumption, Eq. (19a) follows trivially

$$(x, y) = \vec{x} \cdot \vec{y} - x^0 y^0 = \vec{y} \cdot \vec{x} - y^0 x^0 = (y, x). \quad (20)$$

Additionally, Eq. (19b) is satisfied as follows:

$$\begin{aligned} (x, \alpha y + \beta z) &= \vec{x} \cdot (\alpha \vec{y} + \beta \vec{z}) - x^0(\alpha y^0 + \beta z^0) \\ &= \alpha \vec{x} \cdot \vec{y} + \beta \vec{x} \cdot \vec{z} - \alpha x^0 y^0 - \beta x^0 z^0 \\ &= \alpha (\vec{x} \cdot \vec{y} - x^0 y^0) + \beta (\vec{x} \cdot \vec{z} - x^0 z^0) \\ &= \alpha(x, y) + \beta(x, z). \end{aligned} \quad (21)$$

Finally, we prove Eq. (19c) as follows. Suppose that $(x, y) = 0$ for all x but $y \neq 0$. Then, there is some component of y , say y^i such that $y^i \neq 0$. Obviously then, we could choose $x^i = 1$ and the rest of the components of x to be zero, meaning that

$$(x, y) = \begin{cases} y^i & \text{if } i \neq 0 \\ -y^i & \text{if } i = 0 \end{cases}. \quad (22)$$

That is, it must be the case that $y \equiv 0$, otherwise there is always at least one choice of x such that (x, y) is nonzero, which contradicts the original assumption.

1.18) Use the Gram-Schmidt method to find orthonormal linear combinations of the three vectors

$$\vec{s}_1 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \quad \vec{s}_2 = \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}, \quad \vec{s}_3 = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}. \quad (23)$$

Notice that $\hat{u}_1 = \vec{s}_1$ is already normalized, so we can find an orthonormal vector to \hat{u}_2 from \vec{s}_2 as

$$\vec{u}_2 = \hat{s}_2 - (\hat{u}_1, \vec{s}_2)\hat{u}_1 \quad (24)$$

$$= \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} - \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad (25)$$

$$= \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}. \quad (26)$$

Noting that \vec{u}_2 is normalized, we have $\hat{u}_2 = \vec{u}_2$. Lastly, we can repeat the process for the third vector.

$$\vec{u}_3 = \vec{s}_3 - (\hat{u}_1, \vec{s}_3)\hat{u}_1 - (\hat{u}_2, \vec{s}_3)\hat{u}_2 \quad (27)$$

$$= \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} - \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} - \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \quad (28)$$

$$= \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}. \quad (29)$$

Again, $\vec{u}_3 = \hat{u}_3$ since \vec{u}_3 is already normalized. Notice that these are just the standard basis vectors for a three dimensional vector space, so the orthonormal linear combinations of \vec{s}_1 , \vec{s}_2 , and \vec{s}_3 are

$$\begin{aligned} \hat{u}_1 &= \vec{s}_1, \\ \hat{u}_2 &= \vec{s}_1 - \vec{s}_2, \\ \hat{u}_3 &= \vec{s}_1 - \vec{s}_2 - \vec{s}_3 \end{aligned} \quad (30)$$

1.21) Show that a linear operator A that is represented by a hermitian matrix (1.167) in an orthonormal basis satisfies $(g, Af) = (Ag, f)$.

Observe that

$$(g, Af) = g^\dagger Af, \quad (31)$$

where g, f are column vectors and A is represented by a matrix. Recalling that $(AB)^\dagger = B^\dagger A^\dagger$ and that $A^\dagger = A$ since A is hermitian, Eq. (31) becomes

$$(g, Af) = (A^\dagger g)^\dagger f = (Ag)^\dagger f = (Ag, f). \quad (32)$$
